1. Executive Summary

The quick commerce (Q-commerce) sector grew significantly during the COVID -19 pandemic, as platforms promised to deliver essential products within 10–20 minutes. Since then, several Q-commerce platforms have become competitive and successful in India.

Narangikart is a hypothetical new Q-commerce enterprise seeking to strategically establish its presence in five major Indian cities: Delhi, Mumbai, Pune, Bengaluru, and Chennai. The platform aims to assess the performance of three competitors, Blinkit, Instamart, and Zepto, based on stock availability, discounts, and price analysis across these five cities. For this study, data from the three platforms across the five cities were manually collected over seven days.

The analysis suggests that Zepto demonstrated the strongest results across the primary stock availability and discount metrics used in this study, with 603 in-stock observations out of 630 across the five cities during the seven-day observation period. Among these 603 in-stock observations, 474 had discounts. The highest discount observed on Zepto was 33%. Bengaluru also showed particularly strong results for Zepto, based on both stock availability and the number of discounts observed.

Based on the analysis of 18 products across three platforms and five cities, several recommendations can be made for Narangikart. The platform should focus on maintaining strong product availability, as stock availability was an important consideration among the competitors. Maintaining strong product availability and a favorable balance between in-stock and out-of-stock products would also be important. Since discount behavior varied across cities, Narangikart could consider using city-specific discount strategies rather than applying a single national approach. The platform could also consider expanding its Q-commerce services to areas within these cities where competitors are not currently delivering.

In addition to the findings from the analysis, broader operational considerations may also be important for a new Q-commerce platform. These include providing reliable customer service, ensuring easy returns and customer satisfaction, and allowing customers to choose between urgent and non-urgent delivery options. Competitive discount strategies, including periodic promotions or higher discounts on selected days, could help Narangikart compete with established platforms. The platform could also aim to maintain competitive selling prices while monitoring price differences across competitors.

2. Project Objective and Business Questions

Objective:

To understand the competitive positioning of Blinkit, Instamart, and Zepto across selected Indian cities. The analysis aims to identify which platform demonstrates stronger performance in discounts, product availability, and pricing, and determine whether competitive performance varies by city. For the purpose of the study, a hypothetical stakeholder/client called Narangikart was established, which is seeking to establish itself as a Q-commerce platform in these cities.

Questions:

1. What is the stock distribution across all three platforms?
2. How many observations are discounted on each platform?
3. What is the total number of discounted observations for each platform in each city?
4. What is the maximum percentage of discount offered by each platform?
5. Which product type had the highest maximum discount on each platform?
6. What are the average MRP and selling prices?
7. How do discounts, stock availability, and MRP/selling price vary across cities?
8. Which platform shows the highest stock availability in each city?
9. Which platform had the highest frequency of full stock availability by city?

3. Dataset summary and Limitations

Limitations

- This project study is based only on a seven-day observation of three platforms, 18 products, and selected areas within five cities.
- Prices and availability were observed at specific collection times to minimize possible inaccuracies.
- Product availability and prices may change throughout the day.
- Since the data was collected manually, there is a possibility of minor recording errors.
- The analysis is based on observed patterns and does not explain the reasons behind those patterns.
- Findings may not generalize to all products, all Indian cities, or all areas of the cities considered in this study.

Table 1 Dataset Summary

Dimension	Scope
Platforms	Blinkit, Instamart, Zepto
Cities	Delhi, Mumbai, Pune, Bengaluru, Chennai

4. Data Collection and Cleaning

Data Collection Using Excel

The data collection process involved creating a table with 11 columns: Date, City, Platform, Category, Product Type, Product Name, Pack Size, MRP (Maximum Retail Price), Selling Price, Discount, and Stock Status. Three separate Excel workbooks were created, one for each platform, with five sheets representing the five cities.

Each sheet contained a total of 18 representative products from 9 categories. Pack size and product name were kept consistent across all three platforms and five cities. It was also ensured that the areas selected within each city were the same across all platforms. Over the next seven days, MRP and Selling Price data were manually collected.

The Discount column was set up using the formula $(MRP - SP) / MRP$. After entering the values in the price columns, the discount percentage was automatically calculated in the Discount column.

Figure 2 Excel sheet with raw data

Date	City	Platform	Category	Product Type	Product Name	Pack Size	MRP	Selling Price	Discount	Stock Status
22-07-26	Mumbai	Blinkit	Dairy	Milk	Amul Taaza Toned Milk Tetrapack	1 lit	77	77	0	Out of stock

Data Cleaning Using Excel Power Query

The Excel workbooks were loaded into Power Query, and the five sheets representing the cities were appended. The data cleaning process involved:

- Removing null values
- Checking and correcting spelling inconsistencies
- Correcting stock status inconsistencies
- Adding an ID column

The same process was repeated for all three workbooks. The cleaned datasets were then appended using Power Query to form a Master Dataset containing a total of 1,890 observations. The Master Dataset was converted to CSV format for further analysis and visualization.

Figure 3 Master dataset

ID	Date	City	Platform	Category	Product_Type	Product_Name	Pack_Size	MRP	Selling_Price	Discount	Stock_Status

5. Performance Criteria and Metrics

The three platforms were compared based on stock availability, MRP, selling price, and the number of discounted products to assess their performance.

Discount Performance

The number of observations where a product had a discount percentage between 1% and 99%. A discount of 0% represents products with no discount, while 100% represents products that were out of stock.

- 0 = no discount
- 1–99 = discounted
- 100 = out of stock

Stock Availability

The number of observations where a product was marked as in stock and the number of observations where a product was out of stock.

Pricing

Comparison of MRP and selling price in Indian Rupees across platforms and cities.

6. Data Analysis

Tools Used: Microsoft SQL Server and Power BI

The study was divided into three parts:

Part 1: Platform Comparison Within Each City

Based on the selected performance criteria, the performance of the three platforms was compared within each of the five cities. The platform with the highest performance for each criterion was identified and reported.

Part 2: Overall Platform Performance

The overall performance of the three platforms was compared across the five cities during the seven-day observation period for the 18 selected products. The platform demonstrating the strongest overall performance was identified based on the selected performance criteria.

Part 3: Price Analysis

The price analysis involved examining MRP discrepancies across cities and platforms for products with the same brand, product name, and pack size. The average MRP and selling price across the three platforms were also compared.

PART 1: Platform Comparison Within Each City

1A) Stock Availability within each city

Q. Which platform shows highest number of in-stock observations in each city?

```
SELECT  City,
        Platform,
        Instock
FROM    (SELECT  City,
                Platform,
                count(STOCK_STATUS) AS InStock,
                rank() OVER (PARTITION BY city ORDER BY count(stock_status) DESC) AS
rn
        FROM    GroDataset
        WHERE    stock_status = 'in stock'
        GROUP BY City, Platform) AS tbl
WHERE    rn = 1
```

```
GROUP BY city, platform, InStock
ORDER BY InStock DESC;
```

Table 3 Highest number of in-stock observations in each city

City	Platform	Instock
Bengaluru	Zepto	126
Delhi	Zepto	125
Pune	Instamart	122
Mumbai	Blinkit	121
Chennai	Instamart	119

Figure 4 Stock Status by city

Q. Which platform had the highest frequency of full stock availability by city?

```
SELECT City,
       Platform,
       FullyStocked
FROM (SELECT Platform,
            City,
            count(*) AS FullyStocked,
            rank() OVER (PARTITION BY city ORDER BY count(*) DESC) AS rn
```

```

FROM (SELECT Platform,
            City,
            date,
            COUNT(CASE WHEN STOCK_STATUS = 'IN STOCK' THEN 1 END) AS
StockAvailability,
            COUNT(Product_Name) AS TotalProducts
FROM GroDataset
GROUP BY PLATFORM, City, Date) AS a
WHERE StockAvailability = 18
GROUP BY PLATFORM, City) AS b
WHERE rn = 1
ORDER BY FullyStocked DESC;

```

Table 4 Fully stock status in each city

City	Platform	FullyStocked
Bengaluru	Zepto	7
Delhi	Zepto	6
Mumbai	Zepto	3
Pune	Blinkit	3
Pune	Instamart	3
Chennai	Zepto	1

Stock Availability: Key Findings Within Each City

- Zepto showed the highest in-stock count and was fully stocked on all seven days of the observation period in Bengaluru, while it showed its lowest in-stock count in Mumbai. In Chennai, Zepto was fully stocked on only one of the seven observation days.
- Instamart showed its highest in-stock count in Pune and was fully stocked on three out of seven observation days. Mumbai had the lowest in-stock count for Instamart.
- Blinkit showed its highest in-stock count in Mumbai, while it was fully stocked on three out of seven observation days in Pune. Chennai had the lowest in-stock count for Blinkit.

1B) Discounts with each city:

Q. What is the total number of discounts given by each platform in each city?

```
SELECT Platform,
        City,
        sum(Dcount) AS TotalDiscounts
FROM (SELECT Platform,
            City,
            count(Discount) AS Dcount
      FROM GroDataset
     WHERE Discount NOT IN (0, 100)
           AND Platform in ('blinkit', 'Instamart', 'Zepto')
     GROUP BY Platform, City, Discount
     HAVING City in ('Delhi', 'Mumbai', 'pune', 'Bengaluru', 'Chennai')
    )AS TBL
GROUP BY platform, City
ORDER BY Platform, TotalDiscounts Desc;
```

Table 5 Total number of discounts by each platform in each city

Platform	City	Total Discounts
Blinkit	Delhi	70
Blinkit	Pune	69
Blinkit	Mumbai	68
Blinkit	Bengaluru	59
Blinkit	Chennai	57
Instamart	Chennai	65
Instamart	Delhi	65
Instamart	Pune	63
Instamart	Bengaluru	62
Instamart	Mumbai	50
Zepto	Bengaluru	98
Zepto	Delhi	97
Zepto	Pune	96
Zepto	Chennai	92
Zepto	Mumbai	91

Figure 5 Total number of discounts by city

Discounts: Key Findings Within Each City

- Across all five cities, Zepto recorded the highest number of discounts among the three platforms. Bengaluru, Delhi, and Pune recorded the highest number of discounts for Zepto, while Mumbai recorded the lowest.
- For Blinkit, Delhi, Pune, and Mumbai recorded the highest number of discounts, while Chennai recorded the lowest.
- Instamart recorded the lowest total number of discounts among the three platforms. Delhi and Chennai recorded the highest number of discounts for Instamart, while Mumbai recorded the lowest.

Q. Which cities appear to be the primary focus of each platform based on discounting and stock availability?

Table 6 Highest Stock Availability and Discounts by Platform

Platform	Highest Stock Availability	Highest Discounts
Blinkit	Mumbai — 121	Delhi — 70
Instamart	Pune — 122	Chennai and Delhi — 65
Zepto	Bengaluru — 126	Bengaluru — 98

Summary of Platform Comparison Within Each City

The table below summarizes the platform rankings in each city based separately on the number of discounts and in-stock observations.

Table 7 Summary of platform comparison within each city

Performance Metric	Platform Ranking	Cities
Discounts	Zepto > Blinkit > Instamart	Delhi, Mumbai, Pune
	Zepto > Instamart > Blinkit	Bengaluru, Chennai
Stock Availability	Zepto > Instamart > Blinkit	Delhi, Bengaluru
	Blinkit > Zepto > Instamart	Mumbai
	Instamart > Zepto > Blinkit	Pune, Chennai

Part 2: Platform Performance Overall

2A) Overall Stock Availability:

Q. What is the stock distribution in all three platforms?

```
SELECT Platform,
       Stock_Status,
       count(Stock_Status) AS Stockstatus
FROM   GroDataset
GROUP BY Platform, Stock_Status
ORDER BY Platform, Stockstatus DESC;
```

Table 8 Stock distribution

Platform	stock_status	Stockstatus
Blinkit	In stock	570
Blinkit	Out of stock	60
Instamart	In stock	578
Instamart	Out of stock	52
Zepto	In stock	603
Zepto	Out of stock	27

Figure 6 Stock status in each platform

Stock status

● In stock ● Out of stock

2B) Overall Total Discounts:

Q. What is the total number of discounts given by each platform?

```
SELECT Platform,
       count(CASE WHEN Discount NOT IN (0, 100) THEN 1 END) AS TotalDiscounts,
       count(CASE WHEN Discount = 0 THEN 1 END) AS NoDiscounts
FROM GroDataset
GROUP BY Platform
ORDER BY TotalDiscounts DESC;
```

Table 9 Total number of discounts in each platform

Platform	TotalDiscounts	NoDiscounts
Zepto	474	129
Blinkit	323	247
Instamart	305	273

Figure 7 Total number of Discounted and Non-discounted Observations

Discounted vs Non-Discounted Observations

● Products with discounts ● No Discounts

Figure 8 Maximum and Minimum Discounts by platforms

Q: Which product type had the highest discount on each platform?

```
SELECT Product_Type,
       Platform,
       discount
FROM (SELECT Product_Type,
            Platform,
            discount,
            rank() OVER (PARTITION BY platform ORDER BY discount DESC) AS rn
      FROM GroDataset
     WHERE Discount NOT IN (0, 100)) AS a
WHERE rn = 1
GROUP BY Product_Type, Platform, Discount
ORDER BY Discount DESC;
```

Table 10 Product type with highest discounts

Product_Type	Platform	Discount
Rice	Zepto	33
Wheat flour	Zepto	33
Rice	Blinkit	29
Wheat flour	Instamart	25

Summary of Overall Platform Performance

- Overall, Zepto had the highest number of in-stock observations, with 603 out of 630 observations across all five cities. Among these 603 in-stock observations, 474 had discounts. The highest discount observed on Zepto was 33%.
- The stock availability and discount performance of Blinkit and Instamart were relatively similar. Blinkit had a slightly higher total number of discounts (323) and a higher maximum discount of 29%, despite having fewer in-stock observations (570) than Instamart (578).
- Rice received the highest maximum discount on Zepto and Blinkit, while Wheat flour received the highest maximum discount on Zepto and Instamart.

Part 3: Price Analysis

A. Maximum Retail Price (MRP) and Selling Price

- The average MRP across all three platforms was approximately ₹183.
- Zepto had a lower average selling price than Blinkit and Instamart, which may be explained by the higher number of discounted observations recorded for Zepto among the three platforms.

```
SELECT  PLATFORM,
        avg(MRP) AS AvgMRP,
        avg(Selling_Price) AS AvgSP
FROM    GroDataset
GROUP BY Platform
ORDER BY AvgSP;
```

Table 11 Average of MRP and Selling Price

Platform	Average MRP	Average Selling Price
Zepto	₹183.28	₹155.88
Blinkit	₹182.65	₹157.26
Instamart	₹183.00	₹169.00

Figure 9 Average of MRP and Selling Price

B. Variations in MRP Across Cities and Platforms

MRP variation was observed in five of the nine product categories and was analyzed. These variations occurred across both platforms and cities for products with the same product name, brand, and pack size.

Table 12 Variations in MRP across cities and platforms

Product	MRP Range	Difference	Lowest MRP	Highest MRP
Wheat Flour	₹253– ₹360	₹107	₹253 — Delhi, all platforms	₹360 — Chennai and Bengaluru, all platforms
Antiseptic Liquid	₹364– ₹364.19	₹0.19	₹364 — Blinkit and Instamart, all cities	₹364.19 — Zepto, all cities
Cooking Oil	₹200– ₹265	₹65	₹200 — Blinkit, Bengaluru	₹265 — Mumbai, all platforms and Instamart, Bengaluru
Detergent Powder	₹165– ₹242	₹77	₹165 — Blinkit, Chennai	₹242 — All platforms, almost all cities
Tea	₹125– ₹160	₹35	₹125 — Instamart and Zepto, Delhi	₹160 — Blinkit and Zepto, Pune

- Wheat Flour showed the largest MRP range (₹107), while Antiseptic Liquid showed only a ₹0.19 difference.
- For example, Wheat Flour's MRP ranged from ₹253 to ₹360. In Chennai, Blinkit showed two different MRPs of ₹277 and ₹360. Across Mumbai, Pune, Bengaluru, Chennai, and Delhi, the MRPs observed for Wheat Flour were ₹277, ₹277, ₹360, ₹360, and ₹253, respectively.

Figure 10 Variation in MRP: Wheat Flour

Platform	Product Type	City	MRP
Blinkit	Wheat flour	Bengaluru	360.00
Instamart	Wheat flour	Bengaluru	360.00
Zepto	Wheat flour	Bengaluru	360.00
Blinkit	Wheat flour	Chennai	360.00
Instamart	Wheat flour	Chennai	360.00
Zepto	Wheat flour	Chennai	360.00
Blinkit	Wheat flour	Chennai	277.00
Blinkit	Wheat flour	Mumbai	277.00
Instamart	Wheat flour	Mumbai	277.00
Zepto	Wheat flour	Mumbai	277.00
Blinkit	Wheat flour	Pune	277.00
Instamart	Wheat flour	Pune	277.00
Zepto	Wheat flour	Pune	277.00
Blinkit	Wheat flour	Delhi	253.00
Instamart	Wheat flour	Delhi	253.00
Zepto	Wheat flour	Delhi	253.00

7. Key Findings

- Zepto had the highest stock availability: 603 of 630 observations in-stock (96%), including being fully stocked on all seven days in Bengaluru. Mumbai was Zepto's weakest city.
- Zepto gave the most discounts: 474 of its 603 in-stock observations were discounted, the highest of the three platforms. Rice and Wheat Flour reached the highest maximum discount on Zepto, at 33%.
- Blinkit and Instamart performed similarly overall. Blinkit had slightly more total discounts (323) and a higher maximum discount (29%) despite fewer in-stock observations (570) than Instamart (578).
- Zepto gave the most discounts in every city. Stock availability was more mixed: Zepto had the highest number of in-stock observations in Bengaluru and Delhi, Instamart had the highest in Chennai and Pune, and Blinkit had the highest in Mumbai.

City	Most In-Stock Observations	Most Discounted Observations
Bengaluru	Zepto	Zepto
Delhi	Zepto	Zepto
Chennai	Instamart	Zepto
Pune	Instamart	Zepto
Mumbai	Blinkit	Zepto

- Average MRP was ~₹183 across all platforms, but Zepto had the lowest average selling price.
- Identical products showed variations in MRPs across cities and platforms in 5 of 9 categories: Wheat Flour had the widest range (₹107), while Antiseptic Liquid varied by just ₹0.19.

8. Recommendations

The following recommendations are based primarily on the competitive patterns observed in the analysis, along with additional considerations based on observations and general business reasoning.

Maintaining Product Stock

- Maintaining strong product availability, particularly for high-demand products, should be an important priority for Narangikart. Since stock availability varied across platforms and cities, the platform could focus on maintaining sufficient inventory and reducing out-of-stock occurrences.

Discount Strategy

- Competitive discounts could be considered as a strategy to attract and retain customers. However, discount levels should be planned carefully to remain competitive while avoiding potential negative effects on profitability.
- Since discount behavior varied across cities, Narangikart could consider using city-specific discount strategies rather than applying a single national approach.

Expanding Business Within Cities

- Narangikart could consider expanding its Q-commerce services to areas within the selected cities where competitors have limited or no observed delivery availability.

Additional Operational Considerations

In addition to the findings from the analysis, broader operational factors could also be considered. These may include providing reliable customer service, ensuring easy returns and customer satisfaction, and allowing customers to choose between urgent and non-urgent delivery options.

Strategic Warehouse Location

- Narangikart could strategically plan the locations of its warehouses or fulfillment centers to serve nearby areas efficiently. Two possible approaches could be considered:
- Multiple Mini Warehouses: Establishing 2–3 smaller warehouses within or around a high-demand area to ensure that products are positioned closer to customers.
- Centrally Located Larger Warehouse: Establishing a larger warehouse at a strategically located point between two nearby areas, allowing the facility to serve customers across both areas efficiently.
- The appropriate approach could be selected based on factors such as customer demand, order volume, available space, delivery distance, and operational costs.

Delivery Partner Policies

- Narangikart could establish clear policies and guidelines for delivery partners to ensure safe and reliable deliveries. These policies could cover areas such as safe driving practices, professional behavior, delivery procedures, and appropriate working conditions for delivery partners.
